DATA ANALYTICS TASK 1: WEB SCRAPING

Title

Web Scraping of Quotes Website Using Python and BeautifulSoup

Objective

To extract quotes and author names from a public website and create a structured dataset for analysis.

Website Used

quotes.toscrape.com

Tools Used

- Python
- BeautifulSoup
- Requests
- Pandas
- Google Colab

Python Code

```
import requests
from bs4 import BeautifulSoup
import pandas as pd

url = "https://quotes.toscrape.com/"
response = requests.get(url)

soup = BeautifulSoup(response.text, "html.parser")

quotes = []
authors = []

for quote in soup.find_all("span", class_="text"):
    quotes.append(quote.text)

for author in soup.find_all("small", class_="author"):
    authors.append(author.text)

df = pd.DataFrame({"Quote": quotes, "Author": authors})
print(df)
df.to_csv("quotes_dataset.csv", index=False)
```

Sample Extracted Dataset

1. The world as we have created it is a process of our thinking. — Albert Einstein
2. It is our choices that show what we truly are. — J.K. Rowling
3. There are only two ways to live your life. — Albert Einstein
4. The person, be it gentleman or lady, who has not pleasure in a good novel. — Jane Austen
5. Imperfection is beauty, madness is genius. — Marilyn Monroe

Results

- Successfully connected to the website.
- Extracted quotes and author names.
- Created a structured dataset.
- Exported the dataset into CSV format.

Challenges Faced

- Understanding HTML tags and classes.

- Identifying the correct elements containing the required data.

Key Observations

- Multiple quotes belong to the same author.
- The data was neatly organized and easy to extract.
- Web scraping helps create custom datasets for analysis.

Conclusion

Web scraping was successfully performed using Python and BeautifulSoup. The required information was extracted from a public website and stored in a CSV dataset for further analysis.
